dataERP FLOW solutions guide

For manufacturers, architects, designers and businesses that sell furniture or work with manufacturing partners. Choose quotations and rendering alone, or continue with technical documentation and business management.

COS™

In COS, prepare the rendering, dimensioned design, quotation, contract and advance payment. Export the project XML file. The XML contains the project data. In CIS, it is checked and completed to prepare technical production documentation.

CIS™

Parts and material lists. 2D optimisation and cutting plans for full sheets, for panel saws or nesting. Edgebanding documentation and diagrams. Profile, glass and mirror reports. Production drawings and CNC preparation for Biesse, Homag and KDT, with possible adaptation for SCM, IMA and other brands depending on the model and postprocessor.

dataERP™

Plan materials and operations, control costs and see the progress of each job. Requirements, inventory, reusable offcuts and traceability. Time recording by activity and order, attendance and explanation of the daily amount. dataERP complements the project file with linear material optimisation and orders in supplier-required templates.

How to read the prices

Distinguish the initial payment, subscription, fee per project or cabinet and hourly services. Package and operation prices are separate schedules. DTE/CNC service fees are not CIS licence prices. Configuration, VAT and terms are defined in the commercial quotation.

Design services

You do not need to use any design application. Send a clear, detailed, fully dimensioned hand sketch and our team prepares the deliverables your job requires.
